

Pooling of Central and State Sample Data For NSS 66th ROUND

**Economic Adviser
Government of Punjab**
Website: www.esopb.gov.in

PREFACE

The 66th round (July, 2009 – June, 2010) of NSS was earmarked for survey on ‘Household consumer Expenditure’ and ‘Employment and Unemployment’. The survey on ‘household consumer expenditure’ and ‘employment and unemployment’ is the eighth quinquennial survey in the series, the last one being conducted in the 61st round (2004-2005) of NSS. Punjab State is a partner in these surveys since the 14th round, on equal matching basis.

National Statistical commission constituted a professional committee under the Chairmanship of Prof. R. Radhakrishna, to identify the preconditions for pooling of Central and state Sample NSS data, to suggest appropriate methodology for pooling the data and to bridge the data gaps and in turn strengthen the database for decentralized planning and governance.

The necessity for pooling the Central and State sample data arose due to the growing need for improving the precision of estimates of policy parameters such as the incidence of poverty, State Domestic Product (SDP), District Domestic product (DDP) etc., and for strengthening the database at district level required for decentralized planning.

Accordingly the NSC professional committee has recommended certain poolability tests and the methodologies for pooling of Central and State sample data of NSS. In the workshop held on 25th -29th August, 2014 at Chandigarh, it was demonstrated about the poolability tests and pooling the two sets of data and estimating the parameters based on two methods (1) Matching ratio method and (2) Inverse Weight of the variance of estimates method.

Economic and Statistical Organisation, Punjab has prepared the pooled report on NSS 66th round on Household Consumer Expenditure (Type I & II) and Employment and Unemployment survey on the same lines.

I am thankful to the National Sample Survey Office, Ministry of Statistics and Programme Implementation, Government of India for providing detailed guidelines and assistance for pooling the Central and State sample data on the basis of which this report has been prepared.

CHANDIGARH

Dated:

M.L Sharma
Economic Advisor
Government of Punjab

Chapter-I

Introduction

Background

The National Sample Survey Office (NSSO) conduct nationwide survey at regular intervals as part of its “round”, each round usually of a year duration covering several topics of current interest. These surveys are conducted by taking a sample of households selected through a scientific design.

The NSS surveys are planned to generate statistics at state and national level. Although NSS Surveys provide reliable state and national level estimates, but they cannot be used to derive reliable direct estimates at the district level because of small sample size which lead to high level of sampling variability. Ironically there is no regular flow of estimates at further below level. To overcome this difficulty the state DES's were invited to participate with matching samples so as to enable the preparation of estimates at sub-state level which was not possible with the central sample alone. Thus the sample size will be increased and the pooling of the two sets of data would enable better estimates at lower sub-state level.

The theoretical framework of pooling and the methodology as well as the issues concerning operational and technical aspects of poolability of central and state sample data was detailed in the report submitted by one of the professional committee constituted by NSC on pooling of central and state sample data under the chairmanship of Professor R. Radhakrishna.

In the 66th round survey (July 2009 – June 2010), the information on several correlates of household consumer expenditure and employment and unemployment were gathered in order to reveal the multi dimensional aspects of these indicators in India.

State's participation in NSS surveys

The state of Punjab is participating in the NSS surveys since 14th round following identical concepts, definitions and procedures as well as by adopting the same sample design as that of NSSO. The sample size of the Punjab is equal to that of central sample called as the state sample. The main purpose of this programme is to pool the two samples and to obtain dependable estimates for regions within the states.

Application of pooling of Central and State samples

The 73rd and 74th constitutional amendment has brought into existence the democratically elected grassroots institutions of local self governance, with delegated powers, both in rural and urban areas. This has enhanced the demand for local level statistics and necessitated requirement of developing basic capabilities at grass root levels

to organize such statistics in a harmonious manner. In this context, it is envisioned that the survey resources in overall NSS programme both by Central and State agencies can be more effectively utilized to generate lower level estimates of key indicators at district level. 13th Finance Commission in Para 12.99 of its report, noted that “***Comparable estimates of district income are extremely relevant for measuring intra-state income disparities. This will enable State Governments to effectively plan policy and programme interventions. They could also be used as a parameter for horizontal distribution of fiscal transfers***”. The Commission also recommended for granting finance to State Governments, which should be utilized by them for strengthening statistical infrastructure at the district as well as at state level . These requirements are subsequently brought in Institutional framework in the implementation of the 13th Finance Commission.

National Statistical Commission’s (NSC) Recommendations

National Statistical Commission (NSC) constituted the committee on pooling of central and state samples in National sample Surveys (NSS) etc. under the Chairmanship of Prof. R. Radhakrishna. The terms of reference of the committee are as follows:-

- ❖ Conditions to be fulfilled for pooling of Central and State Sample NSS data.
- ❖ Methodology for pooling.
- ❖ Time frame by which the exercise needs to be completed by each State.
- ❖ Generating weighting diagrams from the pooled data at sub-state level for the purpose of consumer price indices (Rural and Urban) including occupation specific indices such as CPI-AL, CPI-IW etc, from the NSS data on consumer expenditure surveys (quinquennial & thin sample).

The National Statistical Commission in its reports has observed the importance of pooling in the following statement:

“The statistical agencies of different State Governments have been participating in the NSS programme and canvassing the same questionnaires in matched samples of households in their respective States following identical concepts, definitions and procedures. Results from the central samples and state sample (s) have occasionally been compared. The main purpose of the programme is to pool the two samples and obtain dependable estimates for regions within the States”.

Pooling undertaken by State Statistical Bureau, Punjab

Since NSSO develops its own in-house software for processing the central sample data, in the deliberations of COCSSO held in the past, it was recommended that NSSO should assist the States in terms of providing common Data Entry Software, Tabulation Software, Instruction Manual & Training and hands on practice to DES personnel. NSSO has already started providing this assistance to States. Punjab is using the Data Entry Software, Validation Software, Tabulation Software supplied by the NSSO

(DPD) for data entry, validation and processing of data. Thus there is complete harmony in data processing process for state sample viz a viz with national sample.

NSS household consumer expenditure survey and employment and unemployment survey of the quinquennial rounds are the two basic sources for distribution of households and population by monthly per capita expenditure (MPCE) class. Expenditure on broad item group of food and non-food by MPCE class and principle activity/Industry wise distribution of work force. These parameters in their respective cross classification have varying degree of precision at national and sub-national levels. This variability in precision is primarily on account of sample counts of observations.

Parameters considered for pooling:

Considering the smaller sample size at district level following broad parameters were considered for pooling.

- a) MPCE on FOOD, Non-FOOD, and Total MPCE derived from detail item for URP, MRP and MMRP.
- b) Household size, sex.
- c) Activity status principal, subsidiary, weekly, daily and their intensity.
- d) District level quantile class computation.

Methodology of pooling:

Two alternate methods are used in pooling the central and state sample data.

- a) **Weighting by Matching ratio:** Building aggregate estimate of pooled sample in proportion matching ratio m:n of central and state sample aggregate estimate where m and n are the allotted sample for central and state sample separately for rural and urban sector. Building ratio estimate of pooled sample as ratio of aggregate estimates.
- b) **Weighting by inverse of variance:** Ratio estimates are built by weighting the ratio estimate of central and state sample in proportion to inverse of variance of ratio of the central and state sample.

Testing the poolability of two sets of data:

District wise following tests were undertaken.

- a) District wise Wald-Wolfowitz run test for MPCE (URP, MRP,MMRP) for central and state sample [non parametric Z-test]
- b) District wise divergence test for MPCE (URP, MRP,MMRP) between central and state sample [parametric Z-test]
- c) District wise distribution test over employed, unemployed and out of labour force.

Tables generated:

Following Tables were generated for central, state and pooled sample along with RSEs separately for rural and urban sector.

- a) District wise estimated number of households and persons by sex and sex ratio and average MPCE (URP, MRP, MMRP) for schedule type-I and II
- b) District wise Value of consumption (Rs.0.00) on food, non-food and total per person for a period of 30 days for each Quantile class of MPCE (URP, MRP and MMRP)
- c) District wise estimated number of person and per 1000 distribution of persons over broad activity status such as self-employed, regular wage-salary, casual-labour, unemployed and out of labour force for male, female and persons of age group 15-24 , 15+ and all age for PS+SS status
- d) District wise estimated number of person and per 1000 distribution of persons over broad activity status such as self-employed, regular wage-salary, casual-labour, unemployed and out of labour force for male, female and persons of age group 15-24 , 15+ and all age for CWS status
- e) District wise estimated number of person and per 1000 distribution of persons over broad activity status such as self-employed, regular wage-salary, casual-labour, unemployed and out of labour force for male, female and persons of age group 15-24 , 15+ and all age for CDS status

Layout of the Report

This report contains four chapters and two appendices including the present chapter giving the introduction and brief history of the report. A brief summary of finding is given in chapter II, pooled estimates of selected indicators of employment & unemployment and results of poolability test are given in chapter III. Results of poolability test and district level estimates of MPCE (URP, MRP and MMRP) based on pooled sample data related to Sch.1.0 are described in chapter IV. Detailed tables at districts level generated from the pooled data related to Sch.10 are given in chapter V. The scheduled 1.0 Type- I, Type-II and schedule 10 used for collecting information on household consumer expenditure and employment & unemployment are given in Appendix-A & Appendix-B.

Sample size of Punjab

Total sample size of Punjab State for central and state sample is given below:

Punjab-RURAL						
	Central sample			State sample		
Schedule	FSU surveyed	HH surveyed	Persons Surveyed	FSU surveyed	HH surveyed	Persons Surveyed
1.0 Type-I	196	1560	7832	196	1560	7761
1.0 Type-II	196	1558	7979	196	1560	7701
10	196	1560	7752	196	1560	7603
Punjab-URBAN						
	Central sample			State sample		
Schedule	FSU surveyed	HH surveyed	Persons Surveyed	FSU surveyed	HH surveyed	Persons Surveyed
1.0 Type-I	196	1555	6950	196	1560	7241
1.0 Type-II	196	1557	6964	196	1560	7308
10	196	1555	6811	196	1560	6989

Chapter-II

Summary of Findings

Run test (one sided) and Mean test was done over MPCE(URP, MRP, MMRP) for testing the Poolability of central and state sample data for urban and rural. Number of districts for which poolability was rejected by both the above mentioned tests is given below:-

Number of Districts for which Poolability was rejected over MPCE by run test using Z statistics (one sided) and Mean test

Type	Sector		
	Rural	Urban	Total Districts
Run Test			
URP	4	2	18
MRP	5	2	18
MMRP	5	2	18
Mean Test			
URP	6	2	18
MRP	4	2	18
MMRP	8	2	18

In the above table run test at 1% critical error the null hypothesis is rejected for 4,5 and 5 rural districts for URP, MRP and MMRP and rejection is 2,2 and 2 in case of urban districts for URP,MRP,MMRP respectively.

In the mean test at 0.5% critical error the null hypothesis is rejected for 6,4 and 8 rural districts for URP, MRP and MMRP and rejection is 2,2 and 2 in case of urban districts respectively.
