

Pooling of Central and State Sample Data For NSS 67th ROUND

**SCHEDULE 2.34 : UNINCORPORATED NON-AGRICULTURAL
ENTERPRISES (EXCLUDING CONSTRUCTION)
(PUNJAB STATE)**

**Economic Advisor
Government of Punjab
website: www.esopb.gov.in**

PREFACE

The 67th round (July 2010-June 2011) of NSS was earmarked for survey on 'Unincorporated non-agricultural enterprises (excluding construction). The result of this survey contain estimated number of enterprises, workers and Gross Value added per worker relating to the unorganised sector of manufacturing, trade and services. One of the objectives of States participation in the NSS programme is to provide a mechanism by which sample size would be increased and the pooling of two sets of data can be done so as to enable better estimates at lower sub-state level. The present publication gives the pooled results of the Central and State sample data at district level for the NSS 67th round.

I wish to place on record my sincere appreciation for the good work done by the officers and staff of Tabulation Section of DES. I acknowledge the sincere efforts done by officers as well as officials of Tabulation Section for data entry, validation and tabulation alongwith the preparation of report.

I hope this report will be of very much use to the planners, policy makers, academicians and researchers. The Department expects suggestions and comments from readers for further improvement in the future endeavours of this kind.

Dated:
Chandigarh

M.L.Sharma

Chapter-I

Introduction

Background

The theoretical framework of pooling and the methodology as well as the issues concerning operational and technical aspects of poolability of NSS central and state sample data was detailed in the report submitted by one of the professional committee constituted by NSC on pooling of central and state sample data under the chairmanship of Professor R. Radhakrishna, Ex-Chairman, National Statistical Commission (NSC). As a follow up action, DPD undertook pooling exercise of central and state sample data of two states and the methodology of pooling was demonstrated along with the exercise of pooling undertaken to the State Govt Officials in two central pooling workshops and 5 GSDP workshops organised in collaboration with NAD and State DES so that DES may undertake the pooling exercise independently in respect of their State. The present exercise is pooling of validated Punjab state sample data of NSS 67th round with the central sample data released.

Emerging need for pooling of estimates:

- There has been, of late, major thrust for lower level data for decentralized planning and development
- 13th Finance Commission, in Para 12.99 of its report, noted that “Comparable estimates of district income are extremely relevant for measuring intra-state income disparities.
- This will enable State Governments to effectively plan policy and programme interventions. They could also be used as a parameter for horizontal distribution of fiscal transfers
- The Commission also recommended for granting finance to State Governments, which should be utilized by them for strengthening statistical infrastructure at the district level.

NSC Committee on pooling:

The Committee was constituted under the chairmanship of Prof. R. Radhakrishna in 2010 to look into following

- Conditions to be fulfilled for pooling of Central and State Sample NSS data
- Methodology for pooling
- Time frame by which the exercise needs to be completed by each State
- Generating weighting diagrams from the pooled data at sub-state level for the purpose of consumer price indices (Rural and Urban) including occupation specific indices

such as CPI-AL, CPI-IW etc., from the NSS data on consumer expenditure surveys (quinquennial & thin sample)

Parameters considered for pooling:

Considering the smaller sample size at district level following broad parameters were considered for pooling.

- District wise estimated number of enterprises and workers by sector, enterprise type [OAE(own account enterprise), EST(establishment), ALL] and BAC [broad activity category: Manufacturing(MFG), Trade and Services]
- State level estimated enterprises and workers by sector, enterprise type (OAE, EST, ALL) and CC (compilation category: 63 NAD CC)
- District wise emoluments per hired worker in establishments by sector and BAC
- State level emoluments per hired worker in establishments by sector and CC (63 NAD CC)
- District wise GVA per enterprises by sector, enterprise type (OAE, EST, ALL) and BAC
- State level GVA per enterprises by sector and CC (63 NAD CC)
- District wise GVA per worker by sector, enterprise type (OAE, EST, ALL) and BAC
- State level GVA per worker by sector and CC (63 NAD CC)

Testing the poolability of two sets of data:

District wise following tests were undertaken.

- a) District wise Wald-Wolfowitz run test for GVAPW by BAC for central and state sample separately for OAE and EST [non parametric Z-test]
- b) District wise divergence test for GVAPW by BAC for central and state sample separately for OAE and EST (Establishments) between central and state sample [parametric Z-test]

Methodology of pooling:

Two alternate methods are used in pooling the central and state sample data.

- a) **Weighting by Matching ratio:** Building aggregate estimate of pooled sample in proportion matching ratio m:n of central and state sample aggregate estimate where m and n are the allotted sample for central and state sample separately for rural and urban sector. Building ratio estimate of pooled sample as ratio of aggregate estimates.
- b) **Weighting by inverse of variance:** Ratio estimates are built by weighting the ratio estimate of central and state sample in proportion to inverse of variance of ratio of the central and state sample.

Poolability test of two sample

- As such two sets of data cannot be merged for generating pooled estimate without testing that the samples are realized from identical distribution function
- Since the parametric distribution of the sample mean is unknown one may adopt non-parametric tests such Run test, Median test, chi-square test etc to test that the samples are coming from identical distribution function
- Median test: Observations in each sample are assigned to two groups, one consisting of data whose values are higher than the median value of the two groups combined, and the other consisting of data whose values are at the median or below
- The statistical power of this test may sometimes be improved by using a value other than the median to define the groups say quintile classes
- Let m^* be the median of the pooled sample data. Constructed 2×2 contingency table as below and use chi-square test if State sample and Central sample have identical median Observed frequency of each cell $O_{ij} = N_{ij}$ where $i = 1$ to 2 , $j = 1$ to 2 .
- Expected frequency of each cell $E_{ij} = (N_{i.} * N_{.j})/N_{..}$ where $i = 1$ to 2 , $j = 1$ to 2 .
- degrees of freedom = $(2-1)*(2-1) = 1$

$$\chi^2 \text{ Value} = \sum_{i=1}^2 \sum_{j=1}^2 (O_{ij} - E_{ij})^2 / O_{ij}$$

Sample-type	no of sample observation		Total
	$\leq m^*$	$> m^*$	
State	N_{11}	N_{12}	$N_{1.}$
Central	N_{21}	N_{22}	$N_{2.}$
Total	$N_{.1}$	$N_{.2}$	$N_{..}$

Multinomial distribution test or chi-square test

- For discrete data such as status of activity, educational level and categorical variable such as land possessed code etc, standard tests of equality of sample proportions of two sets of data based on multinomial distributions, relevant chi-square tests may be used after grouping the attributes/categorical variables into a suitable number of classes so that each class contains adequate number of sample observations

- Construct $2 \times k$ contingency table for k classes at the domain where two sets of data are to be pooled as given in next slide and use chi-square test if State sample and Central sample have identical
- Observed frequency of each cell $O_{ij} = N_{ij}$ where $i = 1$ to 2 , $j = 1$ to k .
- Expected frequency of each cell $E_{ij} = (N_{i.} * N_{.j}) / N_{..}$ where $i = 1$ to 2 , $j = 1$ to k .

$$\chi^2 \text{ Value} = \sum_{i=1}^2 \sum_{j=1}^k (O_{ij} - E_{ij})^2 / O_{ij}$$

$$\text{degrees of freedom} = (2-1)*(k-1) = k-1$$

Sample-type	no of sample observation				Total
	Class-1	Class-2	..	Class-k	
State	N_{11}	N_{12}	..	N_{1k}	$N_{1..}$
Central	N_{21}	N_{22}	..	N_{2k}	$N_{2..}$
Total	$N_{..1}$	$N_{..2}$..	$N_{..k}$	$N_{...}$

Wald-Wolfowitz run test (non-parametric)

- Suppose X and Y are independent random samples with cumulative distribution function (CDF) as $F_s(x)$ and $F_c(y)$
- Null Hypothesis to be tested is $H_0: F_s(x) = F_c(x)$ for all x against alternative Hypothesis is $H_1: F_s(x) \leq F_c(x)$ for all x and $F_s(x) < F_c(x)$ for some x
- Let x_1, x_2, \dots, x_m be iid observation from state sample with distributive function F_s and y_1, y_2, \dots, y_n be iid observation from central sample with distributive function F_c .
- Merge the data and order them with respect to comparable characteristic under consideration say monthly per capita expenditure (MPCE)

Run test:

- In the merged data order sequence: put “1” for X and “0” for Y . Let U be the total runs observed where ‘run’ is a sequence of adjacent equal symbols.

- For example, following sequence: 111100011100111110000 is divided in six runs, three of them are made out of “1” and the others are made out of “0”.
- The total runs U is a random variable whose distribution for large sample can be treated as normal with:

$$\text{mean} = \frac{2mn}{m+n} + 1$$

$$\text{Variance} = \frac{2mn(2mn - m - n)}{(m+n)^2(m+n-1)}$$

- After normalizing the variable U one may use one sided z-test for testing the Null hypothesis. In extreme case the value of U will be 2 meaning by observed characteristic of all the observation of one sample is less than the other samples
- Limitations of this test is when there is a tie between two samples in the observed value. One has to resolve ties in usual manner.
- If there is large number of ties which is bound to occur specially for qualitative attributes like education level this test is not recommended.
- This test can be well applied for a continuous variable such as MPCE which are less prone to ties.
- For discrete variable use chi-square test

Parametric Test:

Aggregate estimate:

- Let t_{yc} and t_{ys} be the estimate of Y at domain level of pooling based on central and state sample respectively with corresponding variances $V(t_{yc})$ and $V(t_{ys})$.
- For large sample, making all assumption of parametric test, one may use Z-Statistic to test the null hypothesis $H_0: E(t_{yc}) = E(t_{ys})$ where E stands for expectation

Aggregate estimate:

$$Z = \frac{(t_{yc} - t_{ys})}{\sqrt{V(t_{yc}) + V(t_{ys})}}$$

$V(t_{yc})$ and $V(t_{ys})$ could be estimated as

$$\hat{V}(t_{yc}) = \sum_l (t_{yc1} - t_{yc2})^2 / 4 \text{ and } \hat{V}(t_{ys}) = \sum_l (t_{ys1} - t_{ys2})^2 / 4$$

Where \sum_l stands for summing over stratum x sub-stratum level variance at the domain of pooling

Estimated rates/ratios:

- Let r_c and r_s be the estimate of population rates R_c and R_s ie ratio Y/X based on central and state sample respectively with corresponding mean square error $MSE(r_c)$ and $MSE(r_s)$.
- For large sample, making all assumption of parametric test, one may use Z-Statistic to test the null hypothesis $H_0: E(r_c) = E(r_s)$ where E stands for expectation.

$$Z = \frac{(r_c - r_s)}{\sqrt{MSE(r_c) + MSE(r_s)}}$$

$MSE(r_c)$ and $MSE(r_s)$ are estimated as follows:

$$mse(r_c) = (\text{var}(t_{yc}) - 2 * r_c \text{ cov}(t_{yc}, t_{xc}) + r_c^2 * \text{var}(t_{xc})) / t_{xc}^2$$

$$mse(r_s) = (\text{var}(t_{ys}) - 2 * r_s \text{ cov}(t_{ys}, t_{xs}) + r_s^2 * \text{var}(t_{xs})) / t_{xs}^2$$

$$\hat{V}(t_{yc}) = \sum_l (t_{yc1} - t_{yc2})^2 / 4 \quad \hat{V}(t_{ys}) = \sum_l (t_{ys1} - t_{ys2})^2 / 4$$

$$\hat{V}(t_{xc}) = \sum_l (t_{xc1} - t_{xc2})^2 / 4 \quad \hat{V}(t_{xs}) = \sum_l (t_{xs1} - t_{xs2})^2 / 4$$

$$\text{cov}(t_{yc}, t_{xc}) = \sum_l (t_{yc1} - t_{yc2})(t_{xc1} - t_{xc2}) / 4$$

Presentation of results:

Summary statements of results are placed in the document both for poolability test and pooled results for Punjab state. Details results are also available in excel sheet and print files generated through the pooling software.

Sample size: Total sample size of Punjab State for CENTRAL and STATE sample is given below:

PUNJAB-RURAL				
	Central sample		State sample
